ABSTRACT:
The objective of this study was to evaluate the antibacterial activity of various extracts of whole plant of *Borreria hispida* (Linn). The extract was prepared from the whole plant of *Borreria hispida* by hot continuous percolation method in Soxhlet apparatus with various solvents (Pet. Ether, ethyl acetate, Methanol). All the extracts of *Borreria hispida* were tested for antibacterial efficacy against *Bacillus subtilis* NCIM 2063, *Bacillus pumilus* NCIM 2327, *Staphylococcus aureus* NCIM 2079, *Pseudomonas aeruginosa* NCIM 2036, *Escheria coli* NCIM 2065, *Klebsiella pneumonia* NCIM 2957. All the three extracts were comparable with standard drug (Ciprofloxacin). The methanolic extract was found to be the most effective anti bacterial activity against the entire organism tested. The minimum Inhibitory concentration of methanolic extract of *Borreria hispida* was found to be the range 250 mcg/ml to 50 mg/ml on tested all the test organisms. This study scientifically supports the usage of whole plant as a remedy for various superficial bacterial and fungal infections in traditional medicine.

Key words: Whole plant of *Borreria hispida*, antibacterial activity, hot continuous percolation.

INTRODUCTION:
The number of multi-drug resistant microbial strains and the appearance of strains with reduced susceptibility to antibiotics are continuously increasing. This increase has been attributed to indiscriminate use of broad-spectrum antibiotics, immunosuppressive agent, intravenous catheters, organ transplantation and ongoing epidemics of HIV infection. In addition, in developing countries, synthetic drugs are not only expensive and inadequate for the treatment of diseases but also often with adulterations and side effects. Therefore, there is need to search new infection-fighting strategies to control microbial infections.

The search for compounds with antimicrobial activity has gained increasing importance in recent times, due to growing worldwide concern about the alarming increase in the rate of infection by antibiotic-resistant microorganisms. More so, many of these plants have been known to synthesize active secondary metabolites such as phenolic compound found in essential oils with established potent insecticidal and antimicrobial activities, which indeed has formed the basis for their applications in some pharmaceuticals, alternative medicines and natural therapies.

Santo et al. repoted that the World Health Organization has indeed recognized medicinal plants as the best source for obtaining a variety of synthetic drugs. No doubt, some studies have identified and isolated the main active ingredients in the plants responsible for this antimicrobial activity. However, the study on medicinal plants will allow for the demonstration of their physiological activity and also catalyze many pharmacological studies that will lead to the development of more toxicity and high sensitivity especially towards the emerging microbial agents.

*Borreria hispida* is belongs to the family Rubiaceae. It is widely distributed in throughout India, up to 900m in hills and on all dry lands as a weed. The seed of *Borreria hispida* is used as PPAR-alpha gene
expression, antioxidant redox status, protein metabolism in STZ diabetic rats. Potential role of *Borreria hispida* in ameliorating cardiovascular risk factor. The literature survey showed that no study has been done on antibacterial activity of *Borreria hispida*. Therefore, we were interested in studying the antibacterial activities of the various extracts of whole plant of *Borreria hispida* (Linn).

**MATERIAL AND METHODS**

**Plant materials**

The whole plant of *Borreria hispida* (Linn), were collected from Naaserath, Tuticorin District of Tamil Nadu, India. Taxonomic identification was made from Botanical Survey of Medical Plants Unit Siddha, Government of India, Palayamkottai. The whole plant of *Borreria hispida* (Linn), were dried under shade, segregated, pulverized by a mechanical grinder and passed through a 40 mesh sieve.

**Preparation of Extracts**

The above powered materials were successively extracted with Petroleum ether (40-60°C) by hot continuous percolation method in Soxhlet apparatus for 24 hrs. The mark was subjected to Ethyl acetate (76-78°C) for 24 hrs and then mark was subjected to Methanol for 24 hrs. The extracts were concentrated by using a rotary evaporator and subjected to freeze drying in a lyophilizer till dry powder was obtained.

**Micro Organisms Used**

The following bacterial strains were obtained from National Chemical Laboratory, Pune, India, and used to study the antibacterial activity of various extracts of whole plant of *Borreria hispida* (Linn).

- *Bacillus subtilis* NCIM 2063
- *Bacillus Pumilus* NCIM 2327
- *Stapylicoccus aureus* NCIM 2079
- *Pseusomonas aeruginosa* NCIM 2036
- *Escherichia coli* NCIM 2065
- *Klebsiella pneumonia* NCIM 2957

**Evaluation of Antibacterial Activity:**

**Filter paper disc diffusion method**

The test solutions of various extracts were prepared by using sterile dimethyl formamide as solvent. Ciprofloxacin (100mcg/ml) was taken as the standards for antibacterial activity. Antimicrobial activity was tested by using the filter paper disc diffusion method, employing 24 hours cultures of the above mentioned organisms. The test organism were seeded into sterile nutrient agar medium by uniformly mixing one ml of inoculum with 20 ml sterile melted nutrient agar cooled to 48-50°C in a sterile petridish. The medium was allowed to solidify.

All the three extracts (test) and standard drugs as well as blank were impregnated in whatmann filter paper disc and placed on solidified medium in the petridish and the petridishes were left undisturbed for two hours at room temperature. The petridishes were then incubated at 37°C for 24 hours and the zone of inhibition was measured.

**Minimum Inhibitory (mm) concentration**

The methanolic extract exhibited maximum antibacterial activity when compared with other two extracts were further tested against all the organisms for evaluation of its antibacterial efficiency at different concentration (250 mcg/ml, 500 mcg/ml, 1 mg/ml, 10 mg/ml, 50 mg/ml) by using the filter paper disc diffusion method. The zone of inhibition was calculated by measuring the minimum dimension of the zone of no bacterial growth around the filter paper disc.

**RESULT AND DISCUSSION**

The antibacterial activity of the various extracts of whole plant of *Borreria hispida* (L) was studied against gram positive and gram negative bacteria shown in Table 1. The methanolic extract of *Borreria hispida* was found maximum antibacterial activity than that of other two extracts like petroleum ether and ethyl acetate extracts. The minimum inhibitory concentration was determined by using methanolic extract of *Borreria hispida*. The minimum inhibitory concentration obtained with different concentration of the methanolic extract and the standard drug are presented in table 2. The minimum inhibitory concentration of the methanolic extract of *Borreria hispida* range from 250 mcg/ml to 50 mg/ml on tested bacteria. Significant antibacterial activity was found with the methanolic extract at a concentration of 250mcg/ml as compared with standard drug ciprofloxacin (100 mcg/ml).

* Standard for Antibacterial-ciprofloxacin

The active principles of *Borreria hispida* are responsible for antibacterial activity. Hence it can be concluded that the methanolic extract of *Borreria hispida* possess a powerful antibacterial action against all the bacteria were tested. This also stands as a scientific support for the usage of this plant for treating fever and in traditional medicine.

CONCLUSION

The results of the above study revealed that the methanolic extract of *Borreria hispida* was exhibit antibacterial activity which might be helpful in preventing the progress of various diseases and can be used in alternative system of medicine. Further, these findings could be used to develop suitable dosage forms such as cream, ointment, and lotion as per the requirement of the treatment.
